Oskar Puchalski

Product Engineer — TypeScript, AI Agents, React

oskarpuchalski17@gmail.com

I build AI agents that do real work inside existing products. I own things end to end, from agent architecture and evals to the interface people use every day, and I always look for the biggest lever to make people's work faster and better. Before agents, I spent nearly four years building React and TypeScript products.

EXPERIENCE

Product Engineer, AI Agents — Panowie Programisci

May 2026 - Present

AI assistant for the staff of a Swiss private boarding school, built as an agent layer on top of their existing platform.

- Took it from the first idea and research through implementation, production and observability.
- Built a **Mastra** agent in TypeScript with 30+ typed tools over the school's API, covering grades, attendance, conduct, exams and timetables.
- Shaped the codebase for agentic development (rules for coding agents, strict lint and type guardrails, evals, isolated parallel environments), so a coding agent can add a new integration quickly and to a high standard.
- Built an eval harness (tool-selection suites and LLM-as-judge scorers) to check prompt and model changes before they ship.
- Made it safe to run on student data: EU-only, zero-data-retention inference with automatic model fallback, PostHog tracing, per-user feature flags, and an access-protected admin panel for reviewing conversations and staff feedback.
- Designed generative UI that turns chat into finished work: clarification cards, editable drafts, reference letters and end-of-term report comments written and revised in conversation.

Frontend Developer — Panowie Programisci

Feb 2024 - May 2026

- Led a multi-month migration of the core table component across two teams, replacing a monolithic component with 25+ props with a composable TanStack-based API I designed, while handling edge cases and accessibility across 80+ affected views.
- Built a Cloudflare Worker for multitenant frontend deployment, enabling a single codebase to serve multiple clients with per-tenant customization.

Frontend Developer — Systell

Aug 2022 - Feb 2024

Worked on one of the largest contact center platforms in Poland, used in operational business environments.

- Built a CSV import feature for large client datasets, including a column-mapping UI that let admins match spreadsheet fields to product fields before confirming the import.
- Shipped production features used by thousands of agents daily, built with **React, TypeScript, Redux and Storybook**.
